

## Continuous Casting Operations Upgrade

- The centralized drive control system platform for caster operations at a leading Canadian steel maker's Hamilton facility had become unsound and non-serviceable, leaving the manufacturer's continuous casting operations vulnerable to process interruptions, downtime, and unacceptable financial losses.
- Brock Solutions addressed the customer's situation by offering a full-scale controls retrofit solution based on a cost-effective, distributed intelligence methodology that provided enhanced reliability by means of a redundant configuration, redundant I/O, and modernized drives and components.
